Whitehaven Coal (WHC) – STRONG BUY

Corporate Valuation

Report Dated: 16 October, 2025

Group 153

Nathan Lai	515047219
Ngoc Anh Vu	540404120

Today Date: 1 September 2025 | Stock Price: $6.75 AUD

Part 1 - Growth Rate of Whitehaven's Revenue

(i) Company Profile

Whitehaven Coal is one of Australia's leading coal mining companies, with operations focused primarily in New South Wales and Queensland (Whitehaven Coal, 2025a). The company employs over 6,000 staff and maintains a diversified portfolio of mines, producing both thermal coal for energy generation and metallurgical coal for use in steelmaking.

Recent History

Whitehaven Coal has undergone major growth over the past decade, with salable coal output rising from 10 Mt in FY2014 to 14 Mt in FY2022, driven by the Maules Creek ramp-up and Narrabri expansion. The 2024 acquisition of BHP and Mitsubishi's Blackwater and Daunia mines significantly expanded its scale and revenue mix. In 2025, Whitehaven sold a 30% stake in Blackwater to two Japanese steelmakers, strengthening Asian partnerships and freeing capital for further growth. Equity output is projected to reach 31 Mt by FY2030, comprising 60% metallurgical and 40% thermal coal. Following pandemic-related losses, strong post-war coal prices enabled rapid deleveraging, a return to net cash, and funding for acquisitions (Whitehaven Coal, 2025b; IBISWorld, 2024).

Business Model

Whitehaven Coal's business model centers on operating cost-efficient, large-scale mines that supply high-quality coal to global markets, with a particular emphasis on Asia (Whitehaven Coal, 2025a). The strategy is built on portfolio diversification, operational efficiency, and growth through targeted acquisitions. As the global energy transition progresses, Whitehaven has shifted its portfolio increasingly toward metallurgical coal to meet rising steel demand in developing economies. The company also aims to maintain a portfolio of large, long-life assets to hedge against commodity price cycles and promote operational stability and competitiveness (Whitehaven Coal, 2025a).

Demand for Company's products

The demand for Whitehaven's products, particularly in Asia, remains robust. The company's premium thermal coal, known for high energy and low emissions, is favored by advanced Asian economies for power generation. Meanwhile, metallurgical coal demand is rising due to growing steel production needs, especially in India and Southeast Asia. While global decarbonization continues, demand for high-quality, low-ash thermal and metallurgical coal remains resilient across Asia, as alternative steelmaking technologies such as hydrogen-based "green steel" are not yet cost-competitive or widely implemented. In the first half of fiscal year 2025, Japan accounted for 49% of Whitehaven's coal sales, followed by India at 11%. Other Asian regions: China, Korea, Malaysia, and Taiwan, as well as Europe, made up an additional 27% of the customer base (Morningstar, 2025). Looking ahead, seaborne Asian demand for metallurgical coal is expected to grow substantially, with India likely to constitute approximately 48% of global seaborne demand by 2050. This reflects increased urbanization and steel production in the region (Whitehaven Coal, 2025b). In 2025, global demand for metallurgical coal increased by 5% year-on-year, driven primarily by Asian consumers (Discovery Alert, 2025).

(ii) Industry Profile

Peer group of Companies – New Hope, Glencore, BHP Group

A relevant peer group for Whitehaven Coal includes New Hope Corporation, Glencore and BHP Group, as all four companies are significant players in the coal mining industry with business activities focused on producing and supplying thermal and metallurgical coal to global markets, particularly Asia.

Strategies in place, how well it is executed

Portfolio Diversification and Growth by expanding its metallurgical coal footprint through strategic acquisitions, shifting its product mix toward higher-value coking coal to capture growing steel demand (Whitehaven Coal, 2025a). In fact, due to the successful integration of Blackwater and Daunia into Whitehaven's operating model with strong site-level ownership of improvement initiatives, FY25 QLD ROM production of 20.0Mt exceeded top end of guidance (17.6 - 19.7Mt) and Daunia ROM recorded at 5.8Mt - strongest result in 5 years, largely reflects productivity improvements in AHS operating model. (Morningstar, 2025)

Operational Efficiency and Cost Management are central pillars of Whitehaven Coal's competitive strategy and have been executed with marked success in recent years. Whitehaven has focused on reducing group cash costs and improving productivity across its mine operations, particularly at Maules Creek and Narrabri. Despite those achievements in operational output and efficiency, Whitehaven remains a price-taker in a capital-intensive industry where maintaining a sustainable competitive advantage requires continuously managing costs and capital expenditure. The company faces ongoing risks such as rising labor, fuel, and transportation costs, which could pressure margins. However, management's focus on embedding strong site-level ownership of improvement initiatives and controlling costs is viewed positively. This disciplined operational approach helps Whitehaven remain competitive amid volatile coal prices and evolving market dynamics, even as returns on invested capital are forecast to remain modest over the medium term (Morningstar, 2025; Whitehaven Coal, 2025a).

(iii) Profit Drivers

Whitehaven Coal's profitability is primarily driven by strong pricing dynamics, particularly for metallurgical coal, which commands a premium due to its essential role in steel production. The company's balanced sales mix between metallurgical and thermal coal allows it to capture value from both markets, with metallurgical coal prices showing relative strength in recent years (Morningstar, 2025). Revenue growth has been underpinned by increased production volumes, highlighted by a 61% rise in sales of produced coal to 26.5 million tonnes in FY25, largely attributed to the performance of its Queensland operations (Whitehaven Coal, 2025b).

Disciplined cost management and productivity improvements continue to support profitability, with unit production costs outperforming guidance in FY25 through enhanced extraction efficiency and optimized supply chain processes (Morningstar, 2025). Strategic capital allocation, including the partial divestment of a 30% stake in the Blackwater mine, has strengthened the balance sheet and provided flexibility for future investments.

Overall, Whitehaven is well-positioned to leverage ongoing demand for premium metallurgical and thermal coal across Asia. Sustained cost discipline, prudent investment decisions, and effective capital management will remain critical to navigating commodity price volatility and ensuring long-term shareholder value creation.

Part 2 – Whitehaven Cost of Debt

The cost of debt was estimated using the total borrowings drawn under Whitehaven Coal's financing facilities as of 30 June 2025 (AUD $2,083m), as reported in Note 5.1, 'Capital structure and financing'. This represents the actual debt on which interest is payable, excluding facilities not utilised at reporting date of $375m. Right-of-use lease liabilities ($193m) has been included in the total lease liabilities calculation. This reflects an 'all interest-bearing obligations approach, which considers all contractual debt obligations of the company, including operational leases, to capture the total effect borrowing cost.

$$r_d = \frac{Total\ interest\ expense}{Facilities\ utilised} = \frac{205}{2083} = 0.0984 = 9.84\%$$

After accounting for a corporate tax rate of 30%, the after-tax cost of debt is:

$$r_d\ (After - tax) = 9.84\% \cdot (1 - 0.3) = 6.89\%$$

Justification: According to Marketforces (2024), Whitehaven's current debt-to-capital ratio at around 20% and they expect an incremental cost of debt based on the current interest rate of Whitehaven's active term loan of 11% (pre-tax). In fact, Reserve bank of Australia recently stated in their Financial Stability Review that vulnerabilities in the global financial system significantly affect financial stability in Australia. Specifically, a significant increase in risk aversion in global markets could sharply increase financing costs, restrict Australian firms' and financial institutions' access to funding and liquidity in global markets.

Part 3 – Estimate cost of Equity Capital (CAPM Model)

Method 1: The cost of equity capital for Whitehaven Coal was estimated using the Capital Asset Pricing Model (CAPM), which calculates the expected return investors require equity investment. CAPM is defined as:

$$r_e = R_f + \beta(R_m - R_f),\ \beta = \frac{Covariance\ (Stock, Market)}{Variance\ (Market)}, r_f = 4.275\%$$

When using CAPM to estimate the cost of equity, it is standard practice to estimate the firm's equity beta by computing averages of equity betas of comparable firms with similar operating risk characteristics.

$$r_e = 4.275\% + 0.72 * (6.43\% - 4.275\%) = 5.819\%$$

Using the Market Return as calculated as the average of the ASX200 returns from the past 10 years, gives us a market premium of $6.43\% - 4.275\% = 2.15\%$, which is very low according to Macquarie University's Business Valuation research Paper which suggests a MRP of 6%.

Method 2: The cost of equity capital using a MRP of 6% - $r_e = 4.275\% + 0.72 * (6\%) = 8.575\%$

Using 6% produces a more **realistic cost of equity**, ensuring that the CAPM-based valuation better accounts for systematic risk, particularly in cyclical or volatile sectors such as mining. Adopting a 6% MRP ensures that the CAPM calculation is **consistent with long-term market expectations** and avoids underestimating the required return on equity.

Part 4 – Valuation Methodology

Pro-forma Income Statement and Balance Sheet Assumptions (Appendix 1).

We have constructed pro-forma financial statements for WHC from 2026E to 2030E based on historical results (2021A–2025A) and company guidance. Key inputs and assumptions are as follows:

Revenue. Base case growth: declining from 3.48% in 2026E to 1.5% in 2030E to reflect a maturing company. Upside scenario: 9.27% consistent with FY26 WHC guidance. Downside scenario: -2.32% in early years. Justification: Revenue growth reflects historical trends, company guidance, and industry outlook. Coal production is cyclical; the decline in base-case growth accounts for market maturity.

Cost of Goods Sold (COGS). Base case: 45% of sales (historical 5-year average). Bull and bear cases: 21% and 66%, respectively. Justification: Based on historical averages and variations in coal mining efficiency, coal quality, and production costs.

Royalties. NSW government royalty rates of 10.8% (open cut) and 9.8% (underground). Justification: Statutory obligations for mining in New South Wales.

Coal Purchases. Fixed at 208M, reflecting 5-year historical averages. Justification: Stable operational cost.

SG&A Expenses. Base case: 59M (5-year historical average, excluding 2024 one-off Blackwater sell-down). Justification: Maintains operational consistency. *See Appendix 1.*

Depreciation & Amortization. 615M per year, reflecting FY26 estimates. Justification: Accounts for long-lived assets and company guidance.

Capital Expenditure (CAPEX). Base case: 0%; upside/downside ±13% based on FY26 guidance. Justification: Supports maintenance and growth of operations.

Operating Net Working Capital (NWC). Set at 9% of revenue (5-year historical average). Justification: Provides consistency with operational liquidity needs.

Taxes. Effective rate of 30%, consistent with Australian corporate tax rate.

Other Items. Non-operating income, unusual expense: assumed zero. Impairment losses: included historical values only.

The "Plug" method was used: After forecasting assets, liabilities, and equity items, cash adjusts to ensure Assets = Liabilities + Equity.

Estimating Weighted Average Cost of Capital – *See Appendix 5.*

$$WACC = w_e * r_e + w_d * r_d * (1 - T)$$

$$\boldsymbol{WACC = 72.95\% * 8.575\% + 27.05\% * 9.84 * (1 - 0.3) = 8.12\%}$$

Part 5 – Whitehaven Valuation and Recommendation

Based on the discounted cash flow (DCF) analysis, Whitehaven Coal has an **implied share price of AUD 28.85**, derived from a WACC of 8.12%, a terminal growth rate of 2%, and projected free cash flows to 2030. The analysis incorporates forecasted revenue growth, operating costs, capital expenditure, depreciation, and changes in working capital, with assumptions grounded in historical performance, company guidance, and industry benchmarks (See Appendices 1–5).

The implied share price significantly exceeds the current market price of AUD 6.75 (as of 1 September 2025), suggesting that the stock is materially undervalued. This reflects Whitehaven's strong operational performance, successful integration of acquisitions such as Blackwater and Daunia, disciplined cost management, and strategic focus on metallurgical coal to meet rising steel demand in Asia.

Whitehaven's profitability is supported by a balanced sales mix between high-quality thermal and metallurgical coal, operational efficiency improvements, and a strong balance sheet following debt reduction and partial divestment of Blackwater. The company's growth potential is underpinned by robust Asian demand, particularly from Japan and India, and a strategic shift towards higher-value metallurgical coal, positioning WHC to capture premium pricing and revenue growth.

Investment Recommendation: STRONG BUY
Given the substantial margin between the implied intrinsic value (AUD 28.85) and the current trading price (AUD 6.75), alongside the company's strong operational and strategic positioning, Whitehaven Coal represents a **Strong Buy** for investors seeking exposure to the coal sector. The current market price provides a significant potential upside, making the stock highly attractive relative to its intrinsic value.

6. Cost of Debt Calculation

Fixed rate instruments – Lease liabilities: $287m

Variable rate instruments – Financial liabilities: $1796m

Facilities utilised at reporting date: $2083m ($287 + $1796)

Interest on borrowings: $191m

Interest on lease liabilities: $14m

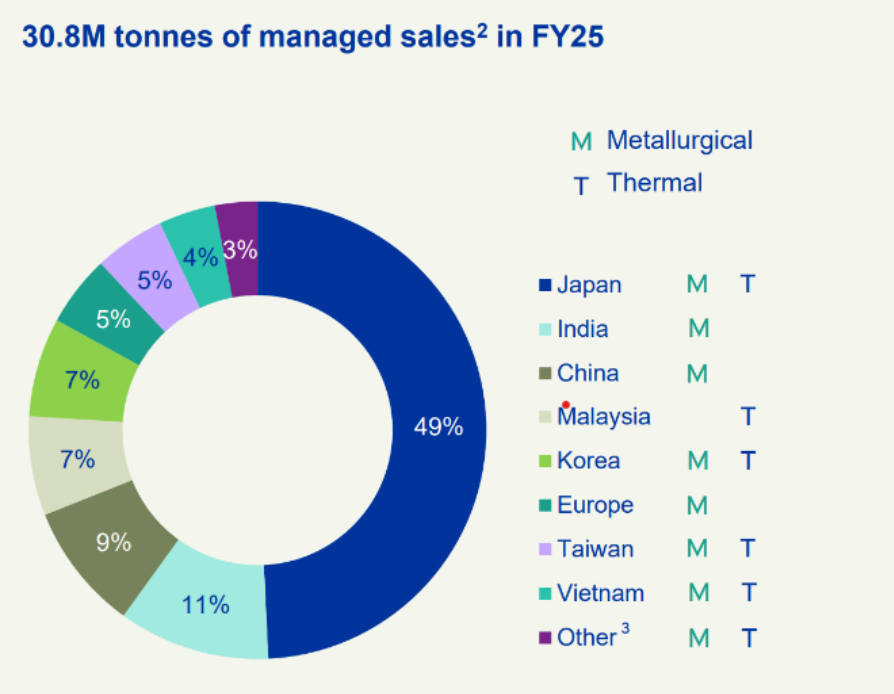
Total interest expense = 191 + 14 = $205m

$$r_d = \frac{Total\ interest\ expense}{Facilities\ utilised} = \frac{205}{2083} = 0.0984 = 9.84\%$$

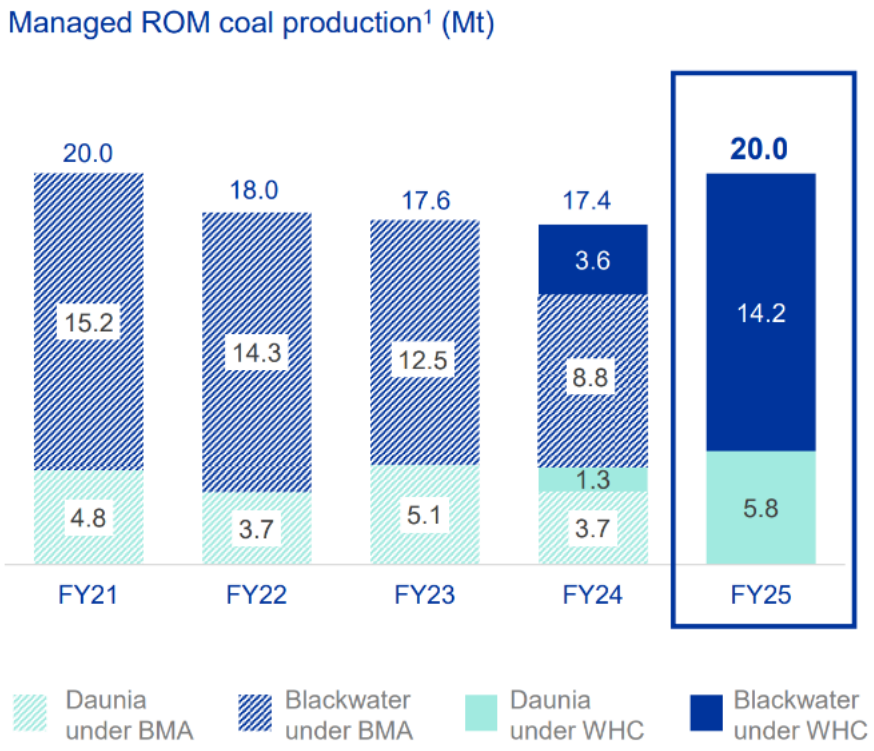
After accounting for a corporate tax rate of 30%, the after-tax cost of debt is:

$$r_d\ (After - tax) = 9.84\% \cdot (1 - 0.3) = 6.89\%$$

7. FY25 Managed Sales Volume by Market and Product Type



8. QLD Operations – ROM Coal Production



9. ROM Production and Sales
